Homework — Photosynthesis: How Plants Make Their Own Food

Practice problems

1. 1 A plant is exposed to sunlight, water, and carbon dioxide. Describe the first two stages of photosynthesis, including where they occur in the plant cell. (maps to: Chloroplasts)
2. 2 Explain how chlorophyll works to capture sunlight energy. What happens to this captured energy? (maps to: Chlorophyll)
3. 3 What are the three ingredients a plant needs for photosynthesis to occur? (maps to: Chloroplasts)
4. 4 Describe the role of the light reaction in photosynthesis. What products are formed during this stage? (maps to: The Light Reaction and Calvin Cycle)
5. 5 Why is photosynthesis important for the Earth's atmosphere? What gas is produced during photosynthesis and why is it essential for animals and humans? (maps to: Chloroplasts)

Reflection prompt

How might changes in sunlight intensity affect the rate of photosynthesis in a plant?

Suggested time

30 minutes
